

A Brief Look Into Linux

Assignment 1

Tom Goncin

July 6th, 2026

ENSE 353

Reason 1

Freedom of autonomy.

Since it is open source anyone has the freedom to do as they wish with it. This freedom implies things such as configuring and curating your own systems architecture; whether that be the back-end or front-end design; like the UI or a server and many more. Linux offers a vast number of desktop environments that offer a diverse set of preferences to their dedicated users utilizing GNOME or KDE; I use Linux Fedora and GNOME.

Reason 2

Security/Stability

Linux developers push updates to the users daily, looming its superiority to the blue-chip corporations that only provide users with an update every several fort nights. This is integral to the strategical advantage that Linux has over its competitors. The model provides strict user privileges which deem advantageous in the pursuit for stability due to the limitation of user errors, viruses, and malware to Linux's core system.

Reason 3

Hardware Support

Due to the versatility of Linux preferences, there are lightweight and heavyweight distributions that grant users the ability to use all sorts of hardware, new and old, powerful and meek. Placing the freedom in the hands of users, their tools and competency levels. This includes all sorts of languages, compilers, development tools that are low floor, high ceiling.

Reason 4

IT/Developers

Since Linux is free and open software, it is completely free to download, install and update. This does not mean that there are no conglomerates piggy backing on the tails of Linux with financial incentives, however, for ones such as RedHat, they must legally provide the build files for others to see and use at their own peril, haha. Fortunately, communities exist such as Rocky do the work for us and build those for us to use. As they say, faster alone, further together. This is just the tip of the iceberg and developers can create and customize their own version, whether for a server, your personal PC, certain electronics, the skies the limit.

Reason 5

Cost

No competitor can match Linux's free to download, install and update. Simple as that. This eliminates the expensive subscriptions for licensing, allowing people and companies to dramatically save on fiscal resources, without creating a disparity from technological limitations. Of course, such as RedHat, you have Linux communities that you may pay for, offering services such as customer service for as aid; also as the professor explained, his former CTO wanted a single neck to choke, haha. Each to their own.

My opinion aligns with these provides reasons. I was always curious about Linux, it intrigued me, however, it is a learning curve which many I have witnessed don't have the curiosity, inquisitiveness or patience to learn. I personally use Fedora, I do enjoy a lot of open-source software, however, what I do not enjoy is how difficult sometimes it is to run other OS dedicated applications over Linux, specifically Word and Excel, which is am very competent with and enjoy. Although this difficulty most likely may be due to my unconscious incompetency, however, the fact that I can run other OS applications on Linux is just another reason why Linux takes the cake.
